Surveys of Inmates in State and Federal Correctional Facilities, 2004

The 2004 Survey of Inmates in State Correctional Facilities (SISCF) and the 2004 Survey of Inmates in Federal Correctional Facilities (SIFCF) were conducted for the Bureau of Justice Statistics (BJS) by the Bureau of the Census. These surveys, collectively referred to as the 2004 Survey of Inmates in State and Federal Correctional Facilities (SISFCF) provide nationally representative data on inmates held in State prisons and Federally-owned and -operated prisons. Through personal interviews conducted from October 2003 through May 2004, inmates in both State and Federal prisons provided information about their current offense and sentence, criminal history, family background and personal characteristics, prior drug and alcohol use and treatment programs, gun possession and use, and prison activities, programs, and services. Prior surveys of State prison inmates were conducted in 1974, 1979, 1986, 1991, and 1997. Sentenced Federal prison inmates were interviewed in the 1991 and 1997 surveys.

Sample Design

The sample of inmates for the 2004 SISCF was selected from two different universe files. The first SISCF universe file, obtained from the BJS 2000 Census of State and Federal Correctional Facilities enumerated on June 30, 2000, contained 1,549 State facilities. The SISCF secondary universe file contained 36 prisons which had been opened between June 30, 2000, and April 1, 2003. The sample for the SIFCF was selected from one universe file obtained from the Federal Bureau of Prisons' (BOP) list of 148 Federally-owned and -operated prisons holding inmates on January 4, 2003. Both surveys used a two-stage sample design. Prisons were selected in the first stage and inmates within sampled prisons in the second stage (see Tables 1 and 2).

A. First-Stage Sampling

For both the State and Federal inmate surveys, correctional facilities were separated into two sampling frames: one for prisons with male inmates and one for prisons with female inmates. Prisons holding both sexes were included in both the male and female sampling frames.

The State prison universe from the 2000 Census of State and Federal Correctional Facilities included 1,192 prisons with only male inmates, 148 with only female inmates, and 209 with both male and female inmates. Consequently there were 1,401 prisons in the male facility frame and 357 prisons in the female facility frame. Of these facilities, 290 State prisons were selected, including 225 male facilities and 65 female facilities.

In the sampling of State facilities, prisons were selected with certainty if the prison population divided by the national inmate sampling interval was greater than 75 (populations greater than 6,445 male and 1,808 female inmates). Additionally, prisons which reported medical, mental health, and geriatric care functions were designated as "self-representing" (SR) if they held more than 1,500 males or 750 females in order to obtain a better representation of inmates in these types of facilities. The remaining non-self-representing (NSR) prisons were allocated to the strata based on population remaining after excluding the SR prisons.

The 14 largest male prisons and 7 largest female prisons were selected with certainty and designated as SR. The remaining 1,387 male prisons and 350 female prisons were each grouped into eight strata, defined by census region (Northeast except New York, New York, Midwest, South except Florida and Texas, Florida, Texas, West except California, and California). Within each stratum, facilities were ordered by size of population. Using selection based on probability proportional to size, 211 male and 58 female prisons were selected.

In addition, two reserve samples of 16 male and 4 female prisons were selected to be visited for interviews only in the event that an insufficient number of prisons in the original sample participated. This sampling occurred in September of 2002.

BJS compiled information on facilities that were opened between completion of the prison Census and April 1, 2003. The resulting list consisted of 27 male prisons, 2 female prisons and 7 coed prisons. A supplemental sample of facilities was drawn from this secondary universe file. The secondary universe was stratified using the same criteria as the original universe file. The supplemental sample included an additional 6 male prisons and 1 female prison. This sampling occurred in June 2003 (see Table 1).

The Federal prison universe included 131 male only, 17 female only prisons, and no coed facilities. The first-stage sampling resulted in selection of 32 male facilities and 8 female facilities (see Table 2).

For the Federal sample, one female and two male facilities were selected with certainty. The remaining male prisons were grouped into five strata based on security level (administrative, high, medium, low, and minimum); similarly, the remaining female prisons were grouped into

two strata based on security level (minimum and all other security levels). Within each stratum, facilities were ordered by size of population and selected with probability proportional to size.

Systematic samples of State and Federal facilities were selected within each stratum using a random start and a sampling interval. Before selecting the sample in each stratum, the number of NSR facilities to be sampled within the stratum was determined by dividing the number of male or female inmates within the stratum by the total population of male or female inmates in all NSR facilities. The sampling interval within each stratum was then calculated by dividing the population in the stratum by the desired number of sample prisons for that stratum. For example, if 200 male NSR prisons were to be selected for sample, and stratum A contained 50,000 male inmates out of a total of 800,000 males in all NSR prisons, the total number of prisons selected from stratum A would be $(50,000/800,000)*200 = 12.5$. Rounding the result, 13 NSR prisons would be selected from stratum A. The sampling interval computed for stratum A would be $50,000/13 = 3,846$. Using this information along with a random start, a random value between zero and the sampling interval, NSR prisons were selected systematically with probability proportional to size. At least 2 NSR facilities were selected in each stratum to allow for within-stratum variance calculations.

Of the 297 prisons selected for the SISCF (290 initial sample plus 7 supplement sample), 14 facilities (6 male and 8 female) resulted in noninterviews or were out of scope (see Table 1). Given the number of State female facilities resulting in noninterviews, the 4 reserve female facilities were added to the sample. This resulted in 301 sample prisons with 14 noninterviews or out of scope cases, and 287 sample State prisons participating in the SISCF. Of the 40 Federal facilities sampled, 1 resulted in noninterviews.

B. Second-Stage Sampling

In the second stage of sample selection in State prisons, interviewers selected inmates for interviewing from a list provided by the facility. The list included all inmates using a bed the previous night. After assigning numbers to each inmate on the list, interviewers entered the total number of inmates into their computers. Using computerized procedures, including a randomly selected starting point and a predetermined skip interval, the computer selected inmates for interview by selecting the numbers corresponding to the facility list. In the SISCF 13,098 males and 3,054 females were sampled.

For Federal facilities, BOP research staff selected the sample from their central list and provided it to the facility 5-7 days prior to the scheduled start of the interviewing. The second-stage sampling for the SIFCF was a two-step process. Since nondrug offenders made up 44% of males and 34% of females in Federal prisons, a systematic sample would result in about the same proportions in the sample. Using a random start and a predetermined skip interval, an oversample of inmates was initially selected so that nondrug offenders would be included in the sample in large enough numbers to be analyzed. From this list, 1 of every 3 drug offenders was retained. This resulted in 3,347 males and 1,009 females in sample. The oversampling and subsampling ensured increased representation of nondrug offenders within the sample while still including enough drug offenders to create reliable estimates on the drug offender population.

As a result, approximately 1 in every 85 males and 1 in every 24 females in State facilities were selected in the State survey and approximately 1 in every 32 males and 1 in every 9 females were selected in the Federal survey. There were 14,499 complete interviews for the State survey and 3,686 for the Federal survey.

The interview, about an hour in length, used computer-assisted personal interviewing (CAPI). With CAPI, computers provide questions for the interviewer, including follow-up questions tailored to preceding answers. Before the interview, inmates were told verbally and in writing that participation was voluntary and that all information provided would be held in confidence. Participants were assured that the survey was solely for statistical purposes and that no individual who participated would be identified in survey results. Inmate data collection occurred between October 2003 and May 2004.

Imputation and Editing Methods

Once all the data were collected, and before the weights were created, three variables (Hispanic origin, Race, Age) had to be processed through an imputation program to impute any missing data for the interviewed records. The method used for imputing missing data is known as a hot deck imputation technique or “nearest neighbor.” The order in which an inmate’s values were imputed were: 1) values from donor inmates within the same prison, and 2) values from donor inmates within the same stratum.

If the Race variable was missing or blank it was imputed only for non-Hispanics. Imputing Race for Hispanics would lead to an overestimate of non-White Hispanics. If both variables were missing, the Hispanic Origin variable was imputed first and this outcome determined whether Race would be imputed.

Any missing values in the Sex variable, for both the interviewed and noninterviewed records, were allocated during the edit-and-recoding portion of the SISFCF processing. If an inmate case was missing a value in the Sex variable, the inmate case would be assigned male or female depending on the frame from which the sampled inmate case was selected.

A different method of imputing missing values for the Hispanic origin, Race, and Age variables was used for the noninterviewed records. Noninterviewed cases were randomly matched to donor records in the interviewed file and information from the donor records was then used for the noninterviewed cases.

Estimation Procedures

The estimation procedures for the SISCF and SIFCF involved weighting the responses from the sampled interviewed inmates to produce estimates with some calculable degree of sampling error. A series of adjustment factors was applied to the basic weight of each interviewed inmate. Weights for Federal and State inmates were calculated separately.

A. Basic weight (BW).

The initial weight, or basic weight, for each sampled inmate is the inverse of the probability of selection. For the SISCF, this was 85.9376 for males and 24.1094 for females. For the SIFCF, this was 31.9161 for males and 9.4167 for females.

B. Drug Subsampling Factor (DSSF)

The Drug Subsampling Factor was calculated for the SIFCF only. This adjustment compensates for the subsampling of drug offenders (taking only a third of those originally selected) by multiplying the assigned weight of the drug offenders by 3 and nondrug offenders by 1.

C. Weighting Control Factor (WCF)

In some prisons, the sampling rate for a facility was adjusted because the actual number of persons in a prison on the sampling date was different from the expected number based on the 2000 Census of State and Federal Correctional Facilities or the 2003 list from the BOP. When the actual number was less than 80% or more than 120% of the expected number, the sampling rate was adjusted to maintain the expected sample size. The WCF was applied to account for adjusting the inmate sampling rate. The WCF is equal to the number of inmates in a facility on the interview date divided by the number expected for that facility. If the outcome was within 20% of the expected number, the WCF was set to 1.

D. Duplication Control Factor (DCF)

Several of the smallest prisons have a total inmate population smaller than the number to be sampled in each facility. For example, if a sample prison contained 15 inmates in which 55 were expected to be interviewed, there would be a shortage of interviewed inmates. The DCF is used to adjust for the workload shortfall in such prisons. It is equal to the expected number of sample inmates in a prison divided by the number of inmates in the prison on the date of the sample. In this example the DCF would be $55/15 = 3.6667$. In most prisons, the calculated DCF was less than 1 because the prison had more total inmates than the expected number in the sample for that stratum; in this case the DCF was set to 1.

E. Person Noninterview Adjustment (PNIAF)

The person noninterview adjustment increases the weights of interviewed persons to account for persons designated for interview but for whom an interview was not obtained. For each inmate,

the PNIAF was calculated using a logistic regression.

The logistic regression method models the response propensity. The logistic regression takes the form:

$$\text{logit}(p) \equiv \log\left(\frac{p}{1-p}\right) = \alpha + \beta x$$

where x is a vector of explanatory variables and $p = \Pr(Y = 1|x)$ is the response probability to be modeled. Y takes on the values one and zero, where the value one represents a response.

The logistic regression method models the response propensity by assigning a probability of success to each respondent. The inverse of the estimated response propensity was used as the PNIAF.

1. Variables Used in the Logistic Regression

The variables used in the logistic regression were age, race/Hispanic origin, sex, stratum, offense type, and drug sample.

2. Results of the Logistic Regression

The result of the logistic regression returns a probability of response to each respondent. The inverse of the probability to respond was assigned as the noninterview adjustment.

3. Apply the Person Noninterview Adjustment Factor

The weight was then multiplied by the appropriate person noninterview adjustment factor for each interviewed person. Persons who were classified as Type A noninterviews were given a weight of 0.

F. Control Count Ratio Adjustment Factor (CCRAF)

The CCRAF adjusts the weighted interviews by stratum level counts as of December 31, 2003. For the SISCF these counts were from the National Prisoners Statistics series (NPS-1B). For the SIFCF, the BOP provided counts of Federal prisoners as of December 31, 2003 (See Tables 3 and 4).

* Includes administrative, high, and low.

The final weight (FW) is the product of the basic weight and all the adjustment factors.

For the SISCF:

$$FW = BW \times WCF \times DCF \times PNIAF \times CCRAF$$

For the SIFCF:

$$FW = BW \times DSSF \times WCF \times DCF \times PNIAF \times CCRAF$$

Accuracy of the Estimates

Since the SISCF and SIFCF estimates come from a sample, they may differ from figures from a complete census using the same questionnaire, instructions, and enumerators. A sample survey has two possible types of errors: sampling and nonsampling. The accuracy of an estimate depends on both types of errors, but the full extent of the nonsampling error is unknown. Consequently, one should be particularly careful when interpreting results based on a relatively small number of cases or small differences between estimates.

A. Nonsampling Variability

There are several sources of nonsampling errors, including the following:

- Inability to obtain information about all cases in the sample
- Definitional difficulties
- Differences in the interpretation of questions
- Respondents' inability or unwillingness to provide correct information
- Respondents' inability to recall information
- Errors made in data collection such as in recording or coding the data
- Errors made in processing the data
- Errors made in estimating values for missing data
- Failure to represent all units in the sample

To minimize these types of errors, quality-control procedures were employed throughout the production process, including scrutiny of the overall survey design, question wording, work of interviewers and coders, and data processing.

B. Nonresponse

Nonresponse in the SISCF and SIFCF resulted from failing to obtain cooperation with sample prisons (first-stage nonresponse) or failing to obtain completed interviews with sampled inmates (second-stage). In the weighting of the sample, the PNIAF adjusted the weights for second-stage nonresponse. The PNIAF was calculated based on age, race/Hispanic origin, sex, stratum, and offense type. However, biases exist in the estimates to the extent that noninterviewed inmates

have different characteristics from those of interviewed inmates in the same age-sex-race/ethnicity-stratum group. For the SISCF, the CCRAF adjusted for the two facility noninterviews. Only one facility in the Federal survey did not participate.

In the second stage, nonresponse resulted from failing to obtain completed interviews with sampled inmates. A total of 1,653 inmates in the State survey and 567 in the Federal survey refused to participate, resulting in 10.2% second-stage nonresponse among State inmates and 13.3% among Federal inmates (Table 5).

Total nonresponse for each survey includes both first-stage and second-stage nonresponse. If the 117 expected interviews in the 2 noninterviewed State facilities are included with the 1,653 second stage refusals, nonresponse for the SISCF is 10.9%. If the 103 expected interviews in the noninterviewed Federal facility are included with the 567 second-stage refusals, nonresponse for the SIFCF was 15.4% since all Federal facilities participated.

*Two facilities in the State sample and one in the Federal sample refused to participate.

C. Comparability of Data

Data obtained from the SISCF and SIFCF are not entirely comparable with data from other sources. This is because of differences in interviewer training and experience and in differing survey processes. This is an example of nonsampling variability not reflected in the standard errors. Caution should be used when comparing results from different sources.

Note on results based upon a small number of cases or small differences in estimates: When summary measures (such as medians and percentage distributions) are computed on a base smaller than those listed in Table 6, they probably do not reveal useful information because of the large standard errors involved. Also, when working with results based on small differences keep in mind that even a small amount of nonsampling error can cause a borderline difference to appear significant or not, thus distorting a seemingly valid hypothesis test.

	Male	Female
Federal (SIFCF)	2000	500

D. Sampling Error

For a given estimator, the difference between an estimate based on the sample selected and the actual parameter for the entire population is known as sampling error. Standard errors are primarily measures of the sampling error, although they may include some nonsampling error. The sample estimate and its standard error enable one to construct a confidence interval, a range that would include the average result for all possible samples with a known probability. For example, if all possible samples were surveyed under essentially the same general conditions and sample design, and if an estimate and its standard error were calculated from each sample, then approximately 95% of the intervals from 1.96 standard errors below the estimate to 1.96 standard errors above the estimate would include the average result of all possible samples. A particular confidence interval may or may not contain the average estimate derived from all possible samples. However, one can say with specified confidence that the interval includes the average estimate calculated from all possible samples. Standard errors may also be used to perform hypothesis testing.

E. Generalized Variance Estimates

A number of approximations are required to derive, at a moderate cost, standard errors applicable to estimates from these two surveys. Instead of providing an individual standard error for each estimate, two parameters, ‘a’ and ‘b,’ are provided to calculate standard errors for each type of characteristic (see Tables 7 and 8). Using these parameters, called generalized variance parameters, provides a more stable estimate of variance. Generalized variance parameters are computed with the knowledge that certain groups of estimates have similar relationships between variances and expected values. Like all estimates, the standard errors derived by using the parameters (as well as the parameters themselves) have associated standard errors of their own, but they are expected to be smaller than their directly calculated variance counterparts, thus providing a more stable estimate of variance.

The generalized variance function is a simple model that expresses the variance as a function of the expected value of the survey estimate. The parameters were estimated from replicate variance estimates. They were calculated, using a stratified jackknife procedure, for the total sample and for sex, and race/ethnicity subgroups (male or female; Black non-Hispanic, non-Black non-Hispanic, or Hispanic). Variables for which variances were estimated, included criminal justice status, prior sentence to incarceration, prior sentence to probation, current offense (murder or manslaughter, sexual offense, assault, robbery, other violent, drug offense), marital status, ever used marijuana, ever used cocaine or crack, alcohol use, armed during crime, HIV status, military service, one or more victims, education, age, monthly income prior to arrest, whether physically or sexually abused, family member ever in prison, employment status at arrest, whether under the influence of drugs at time of arrest, whether under the influence of alcohol at time of arrest, whether maximum sentence was less or more than five years, disability status, children, whether received help for a mental or emotional problem, and persons lived with while growing up.

These variances were calculated for the general form $\sigma^2 = ax^2 + bx$. They were then transformed logarithmically and plotted in a regression in several iterations excluding outliers until a best fit was obtained. Hence, the 'a' values are the intercepts and the 'b' values are the slopes of the lines (see Tables 7 and 8).

Tests may be performed at various levels of significance, where a significance level is the probability of concluding that the characteristics are different when, in fact, they are the same. To conclude that two parameters are different at the 0.05 level of significance, for example, the absolute value of the estimated difference between characteristics must be greater than or equal to 1.96 times the standard error of the difference.

F. Standard Errors of Estimated Numbers Using Generalized Variance Estimates

The approximate standard error, s_x , of an estimated number from this survey can be obtained using the formula:

$$(1) \quad s_x = \sqrt{ax^2 + bx}$$

Here x is the size of the estimate and ‘a’ and ‘b’ are the parameters in Tables 7 and 8 associated with the particular type of characteristic. When calculating standard errors from cross-tabulations involving different characteristics, use the set of parameters for the characteristic which will give the largest standard error.

Illustration:

According to the SISCF, there were 212,356 male State prison inmates 24 years of age or less. Using the appropriate formula (1) and the parameters from Table 7, the standard error is calculated where

Number, x	212,356
Parameter a	-0.000205
Parameter b	234.123
Standard error, s_x	6361.8
95% confidence interval	199,886.9 to 224,825.1

$$s_x = \sqrt{-0.000205 \times 212,356^2 + 234.123 \times 212,356} = 6,361.8$$

The 95% confidence level for male State prison inmates 24 years of age or less is calculated as $212,356 \pm (1.96 \times 6,361.8)$ or 199,886.9 to 224,825.1. A conclusion that the average estimate, derived from all possible samples, lies within a range computed in this way would be correct for roughly 95% of all possible samples.

Illustration:

According to the SIFCF, there were 33,519 Federal prison inmates who were married. Using the appropriate parameters from Table 8 and formula (1) where

Number, x	33,519
Parameter a	-0.00079
Parameter b	102.164
Standard error, s_x	1592.7
95% confidence interval	30,397.3 to 36,640.7

$$s_x = \sqrt{-0.00079 \times 33,519^2 + 102.164 \times 33,519} = 1,592.7$$

The 95% confidence level for Federal prison inmates who were married is calculated as $33,519 \pm (1.96 \times 1,592.7)$ or 30,397.3 to 36,640.7. A conclusion that the average estimate, derived from all possible samples, lies within a range computed in this way would be correct for roughly 95% of all possible samples.

G. Standard Errors of Estimated Percentages Using Generalized Variance Estimates:

The reliability of an estimated percentage, computed using sample data for both numerator and denominator, depends on the size of the percentage and its base. Estimated percentages are relatively more reliable than the corresponding total estimates, particularly if the percentages are greater than 50%.

The approximate standard error of an estimated percentage, $s_{x,p}$, can be obtained by using the formula

$$(2) \quad s_{x,p} = \sqrt{\frac{b}{x} p(100-p)}$$

Here x is the total number of inmates, p is the percentage ($0 \leq p \leq 100$), and 'b' is the parameter in Table 7 or Table 8 associated with the characteristic in the numerator of the percentage.

Illustration:

According to the SISCF, 14.0% of female State prison inmates are Hispanic. Using the appropriate 'b' parameter from Table 7, the standard error is calculated where

Percentage, p	14
Base, x	82,795
Parameter b	45.865
Standard error, $s_{x,p}$	0.82
95% confidence interval	12.4 to 15.6

$$s_{x,p} = \sqrt{\frac{45.865}{82,795} \cdot 14(100-14)} = 0.82$$

The 95% confidence interval for the estimated percentage of Hispanic female State prison inmates is calculated as $14.0 \pm 1.96(0.8)$, or 12.4% to 15.6%.

H. Standard Error of The Difference Using Generalized Variance Estimates:

The approximate standard error of an estimated difference, s_{x-y} , can be obtained by using the formula

$$(3) \quad s_{x-y} = \sqrt{s_x^2 + s_y^2}$$

where s_x and s_y are the standard errors of the estimates, x and y. The estimates can be numbers, percentages, ratios, etc. This represents the actual standard error quite accurately for the

difference between estimates of the same characteristic in two different samples, or for the difference between separate and uncorrelated characteristics in the same sample. However, if there is a high correlation between the two characteristics, formula (3) will overestimate the true standard error.

Illustration:

According to the SIFCF, 30.5% of Federal prison inmates are non-Black, non-Hispanic; according to the SISCF, 40% of State prison inmates are non-Black, non-Hispanic. The apparent difference in the percentages is 9.5%. Using the appropriate parameters from Tables 7 and 8 and formulas (2) and (3), we get

	x	y	Difference
Percentage, p	30.5	40	9.5
Base	129,299	1,226,171	
Parameter b	138.275	291.648	
Standard error	1.5	0.8	1.7
95% confidence interval	27.6 to 32.4	38.4 to 41.6	6.2 to 12.8

The standard error of the difference is calculated as

$$s_{x-y} = \sqrt{1.51^2 + .76^2} = 1.7$$

The 95% confidence interval for the estimated difference in the percentage of Federal and State prison inmates who are other non-Hispanic is calculated as $9.5 \pm 1.96(1.7)$, or 6.2 to 12.8. Since this interval does not include zero, it can be concluded with 95% confidence that the proportions of other non-Hispanic inmates in Federal and State prisons are actually different.

I. Standard Errors Using Direct Variance Estimates

Standard error estimates for specific variables can be derived using software packages developed to generate standard errors for data obtained from a complex sample survey design. Variables have been added to the data files to be used in running such software packages. The variables in Table 9 give sample and universe information.

Table 9. Variables Providing Sample/Universe Information

v2970	Total numbers of male and female inmates in the universe
v2933	Total numbers of male and female inmates in the universe by stratum
v2969	Total numbers of prisons sampled and interviewed by stratum
v2971	Total number of male and female inmates interviewed within each sampled prison
v2932	Total number of prisons in the universe within each stratum
v2603	Stratum code for the State and Federal facilities
v2609	Male and female population for sampled facility according to the 2000 Census of Prisons as of 6/30/2000
v2931	Number of inmates sampled including interviewed and Type A noninterviewed inmates by stratum

A stratified jackknife method¹ was used to calculate specific direct variance estimates within this report. This method sequentially removes an variance unit from the sample and computes an estimate for each unique sample generated from this process. The estimates are then used to calculate the direct variance. Replicate weights reflect the changes in the weights to account for the zero-weight given to the deleted element. Replicate weights are provided within the data files along with final weights needed to create estimates from the surveys. Variable information regarding the weights and replicate weights is given in Table 10.

Table 10. Variable Information for Replicate Weighting Provided within Data File

v2622	Final weight for State male inmates only
v2623 through v2831	Replicate weights for State male inmates only
v2832	Final weight for State female inmates only
v2833 through v2887	Replicate weights for State female inmates only
v2888	Final weight for Federal male inmates only
v2889 through v2918	Replicate weights for Federal male inmates only
v2919	Final weight for Federal female inmates only
v2920 through v2928	Replicate weights for Federal female inmates only

Replicate weights are necessary to apply the jackknife because during each replication a new omission (or zero weight) of a sample element is made. The weighting mechanism needs to reflect this in order for the estimate during that iteration to be accurate. Thus, the replicate weights are defined within these variables for each *k*th replicate estimate for the specified survey.

The total number of replicates is equal to the total number of noncertainty prisons. After all the estimates have been computed, an appropriate variance can be calculated. Thus, the specific replicate weights are necessary to compute specific variance estimates for each survey (State/Federal) and universe (male/female).

In general, the sample variance estimate for a particular survey is

$$v(\hat{\theta}) = \sum_k \frac{(\hat{\theta}_k - \hat{\theta})^2}{repfactor_k}$$

where :

$\hat{\theta}_k$ = estimate for replicate k using the appropriate replicate weight

$\hat{\theta}$ = full sample estimate using the sample final weight

$repfactor_k$ = the replicate factor associated with the replicate, equal to the ratio $r/(r-1)$ where r represents the total number of nonself-representing prisons within the stratum undergoing the deletion process for replicate k .

The strata used in the variance estimation are the same strata described in the sampling portion of this report. Noncertainty prisons were first assigned to variance strata based on their sampling strata and are the variance units within each stratum. For certainty prisons, a similar allocation method was used with the exception that the individual prisoners from each certainty prison were first divided equally into a number of groups equal to the number of noncertainty prisons. Each group was then assigned to an existing variance unit. These variance units are sequentially removed from the sample and re-weighted to create the replicate estimates.

An example is given here using the Federal survey to calculate the direct variance of the number of female inmates with a criminal justice status of "New Court Commitment." In this example, there are two variance strata and within these strata there are three and four variance units, respectively. Using the following equations, one can calculate the estimated number of "New Court Commitment" female Federal prison inmates and the corresponding direct variance estimate. The estimate can be found by multiplying the final weight times the response x_i (an indicator variable 1: New Court Commitment):

$$\hat{\theta} = \sum_i x_i w_i \text{ where } i \text{ is the observation and } w_i (\text{v2919}) \text{ is the final weight of the observation.}$$

Let $\hat{\theta}_k = \sum_i x_i w_{ki}$ where k is the replicate number, and w_{ki} (one of v2920:v2928) is the replicate weight associated with that observation for the k th replicate.

The variance estimate then takes the form:

$$v(\hat{\theta}) = \sum_k \frac{(\hat{\theta}_k - \hat{\theta})^2}{repfactor_k} \text{ where } repfactor_k \text{ is the replicate factor.}$$

Table 11 shows the final estimates and partial calculations.

Table 11. Example of Direct Variance Calculation for Federal Female Prison Inmates with Criminal Justice Status: “New Court Commitment”						
Replicate Number (k)	Stratum	Omitted Variance Unit	Replicate Factor	Replicate Estimate	$\frac{(\hat{\theta}_k - \hat{\theta})^2}{repfactor_k}$	
1	1	1	1.5	6878.4761	5751.34013	
2		2	1.5	7085.0369	8615.291851	
3		3	1.5	6942.8527	541.6938173	
Stratum 1 Total Variance					14908.33	
4	2	1	1.333	7056.1799	5396.226392	
5		2	1.333	6861.5535	9042.964298	
6		3	1.333	6975.4745	12.71073194	
7		4	1.333	6990.046	262.002115	
Stratum 2 Total Variance					14713.48	
				Estimate $\hat{\theta}$	Total Variance $v(\hat{\theta})$	
				6971.358	29621.81	

From this example, the estimate is shown to be 6971.358 and the jackknife direct variance estimate is 29621.81. Using this same strategy, other specific variance estimates can be calculated.

Section 2 — CURRENT OFFENSES

Offense input fields are a length of 40 characters throughout the questionnaire. Movement is: offense field then move right to the corresponding count field. Count fields should be length of 3. Count range should be 1-999, blank, D, or R.

If the item contains the fill instruction, "(Insert offenses from S?Q?)" and the referring item allows multiple entries (i.e. 5 offenses) then "(READ ABOVE OFFENSES) will be displayed in the question on the screen and the appropriate offenses will be displayed above the question. For referring items that just have 1 entry, the fill will be displayed in the question.

If Storage Item 2B or Storage Item 4A is blank use "offense" for fills in items.

Release Status

Conditional Release - The release from a Federal, State or local correctional facility of an inmate who has not served his or her full sentence and whose freedom is contingent upon obeying specified rules of behavior.

Escape - An offender on escape has fled from a prison, jail or other correctional facility without an official release from physical custody. Also, an offender on escape may fail to return to a correctional facility after authorized leave.

Parole - An offender on parole was conditionally released from a prison by a parole board prior to completion of sentence. While on parole, the released offender is placed under the supervision of a parole agency and must obey all conditions set forth by the parole authority.

Probation - An offender on probation is free as long as the person meets certain conditions of behavior. If the freedom is granted by a judicial officer, judge, or court, it is called probation from court. If the conditional release is granted after the offender has served time in a correctional facility, it is probation from prison.

Shock Probation/Split Sentence - A sentence requiring the convicted person to serve a period of confinement in a local, state or federal facility followed by a period of probation. The term is often used for sentences to boot camp, followed by supervision in the community.

Correctional Facility - Buildings operated by a government agency or by contract with a government agency for the physical custody of sentenced persons or persons subject to criminal proceedings. Correctional facilities include prisons, jails, juvenile facilities, detention centers, community based facilities such as pre-release centers and work-release facilities, and non-traditional facilities such as boot camps. It excludes lock-ups.

Serve Time - Spend a period of time in a correctional facility because of a sentence. Does not refer to time in a correctional facility pending a trial or sentencing unless that time is later applied to the sentence.

h_PLEA

Alford plea - A guilty plea to a charge by the defendant, despite his claim of innocence, because the evidence of guilt is overwhelming. Usually the plea is to a charge less than the original charge. The defendant agrees to plead guilty because he realizes that there is little chance to win acquittal on the original charge because of the strong evidence of his guilt.

No contest plea - A defendant's formal answer in court to the charge(s) contained in a complaint, information, or indictment, stating that he or she will not contest the charge(s), but neither admits guilt nor claims innocence.

Guilty plea - A defendant's formal answer in court to the charge(s) contained in a complaint, information, or indictment, stating that he or she will not contest the charge(s) and admits that he/she committed the offense(s) listed.

Not guilty plea - A defendant's formal answer in court to the charge(s) contained in a complaint, information, or indictment, claiming that he or she did not commit the offense(s) listed.

Drug Offense (FR_INST_5F)
Public Order Offense (FR_INST_5F1)
Other (S5Q1)

- 1) Refer to the offense presented on the screen.
- 2) Review the different offenses listed under any of the FR_INST and determine if the offense is similar to the listed offenses.

Violent Offense - Any offense involving personal injury or threat of personal injury through direct or indirect contact between the victim and the offender. In a violent crime, the offender must harm or threaten a person.

Example: A man is armed with a gun and robs a woman. Even though the woman is not harmed, she was physically threatened by the robber. This is a violent crime.

Drug Offense - any offense that involves the illegal possession, manufacturing, distribution, sale or use of a drug or controlled substance, illegal alteration of prescriptions, or illegal possession of drug paraphernalia.

Property Offense - any offense in which property is taken, damaged, or destroyed directly or by fraud or deceit. Any offense involving the illegal possession, sale, distribution or use of money or property. General categories include arson, burglary, fraud, larceny, motor vehicle theft, stolen property, and theft. No contact occurs between the offender and the owner of the property.

Public Order Offense - any offense which violates the rules and regulations governing social order or accepted moral rules/public opinion. Examples include bribery, gambling, prostitution, and corruption. Excluded are crimes directed against individuals or groups or their property.

Firearms are weapons that use gunpowder to shoot a bullet. Primary types are handguns, rifles, and shotguns.

Handgun - a firearm designed to be held and fired with one hand. Primary types are revolvers and pistols. Types of pistols include conventional semi-automatics, submachine gun-style semi-automatics, fully-automatics, derringers, and single shots.

Rifle - a firearm designed to be fired with two hands with the stock held against the shoulder. It has a barrel that is at least 16 inches long and fires single bullets. Examples include bolt-actions, lever-actions, pump-actions, single-shots, modern military-style semi-automatics, other semi-automatics, and fully-automatics.

Shotgun - a firearm designed to be fired with two hands with the stock held against the shoulder. It is designed to fire a cluster of small pellets, often called "BBs" or "shot." Examples include bolt-actions, pump-actions, double-barrels, single-shots, semi-automatics, and revolving cylinders.

BB gun, pellet gun, or toy gun - These are not firearms. A BB gun or pellet gun uses air pressure, rather than gunpowder, to shoot a single BB or pellet. A toy guns only looks like a gun, but doesn't fire bullets.

Handgun Definitions

Handguns are firearms designed to be held and fired with one hand. Primary types are revolvers and pistols.

Revolver - a handgun with a cylinder that has several chambers, each holding one round of ammunition. For each shot, the cylinder rotates, lining up a chamber with the barrel.

Derringer - a compact pistol with one or two barrels that hold one round of ammunition each and must be reloaded manually after each shot.

Conventional semiautomatic pistol - a firearm that holds its ammunition in a removable magazine or clip that is inserted into the pistol. When the trigger is pulled, the pistol fires once and reloads itself. The trigger must be pulled for each shot. A MAXIMUM of 19 bullets can be stored in the magazine.

Submachine gun-style semiautomatic pistol - a very large semiautomatic pistol that looks like a submachine gun. The magazine holds 20 or more rounds of ammunition.

Fully-automatic pistol - ANY pistol which, if the trigger is held down, will fire rapidly and continuously. It is NOT a semi-automatic gun, for which the trigger must be pulled for each shot.

Rifle Definitions - *Used for items S5Q17d, S5Q18d, & S5Q19d*

Rifle - a firearm designed to be fired with two hands with the stock held against the shoulder. It has a barrel that is at least 16 inches long and fires single bullets.

Bolt-action, pump-action, lever-action, or single-shot rifle - a rifle that fires one shot at a time and requires manual operation of some part of the rifle – a bolt, lever, or pump – to reload between shots.

Modern military-style semiautomatic rifle - a rifle that shoots one bullet and reloads itself each time the trigger is pulled. The trigger must be pulled separately for each shot. It has an ammunition magazine that is visible below the rifle and features such as a pistol grip, folding stock, flash suppressor, and bayonet mount.

Other semiautomatic rifle - a rifle that shoots one bullet and reloads itself each time the trigger is pulled. The trigger must be pulled separately for each shot. It does NOT have a detachable ammunition magazine or features such as a pistol grip, folding stock, flash suppressor, or bayonet mount.

Fully-automatic rifle - a rifle that fires continuously as long as the trigger is held down. It is NOT a semi-automatic gun, for which the trigger must be pulled for each shot.

Shotgun Definitions

Shotgun - a firearm designed to be fired while held with two hands with the stock held against the shoulder. It may have either a single- or double-barrel designed to fire a shell filled with small pellets, often called “BBs” or “shot.”

Sawed-off shotgun - ANY shotgun in which the barrel(s) has been shortened or sawed off and is less than 18 inches in length. Any kind of shotgun can be sawed-off.

Bolt-action, pump-action, lever-action, double-barreled, or single-shot shotgun - a shotgun that requires manual operation of some part of the shotgun – a bolt, lever, pump, or opening the barrel – to reload between shots.

Semiautomatic shotgun - a shotgun which shoots once each time the trigger is pulled, ejects the empty shell case, and inserts the next shell into the barrel. The trigger must be pulled separately for each shot.

Revolving cylinder shotgun - a shotgun that holds ammunition in a cylinder that revolves around the barrel between shots.
